

BUSINESS INTELLIGENCE REPORT

Superstore Sales Performance Analysis

United States | 2015 – 2018 | 9,800 Transactions

Prepared by

Aman Khan S

Data Analysis Intern

Digital University of Kerala (DUK)

Report Details

Dataset: Sample Superstore (Kaggle)

Date: June 2026

Classification: Internship Project

1. Executive Summary

This report presents a comprehensive analysis of four years of sales transaction data (2015–2018) from a US-based retail superstore operating across four geographic regions: West, East, Central, and South. The dataset comprises 9,800 line items across 4,922 unique orders, generated by 793 customers, spanning three product categories and 17 sub-categories.

The overarching objective is to identify revenue patterns, operational inefficiencies, customer behaviour trends, and geographic concentration risks — and to translate each finding into specific, actionable recommendations that senior leadership can implement to improve business performance.

Key Performance Indicators at a Glance

Total Revenue \$2.26M 2015 – 2018 cumulative	Total Orders 4,922 9,800 line items	Unique Customers 793 Avg \$459/order	Avg Ship Time 3.96 d Range: 0 – 7 days
2018 Revenue \$722K +20.3% vs 2017	Best Region West \$710K · 31.4%	Best Category Tech \$827K · 36.6%	South Gap –45% vs West region

Critical Findings Summary

- Revenue grew 50.5% over four years — but a significant dip in 2016 (–4.3%) signals a period of instability that warrants investigation.
- Q4 (October–December) generates 38.5% of annual revenue, while Q1 (January–March) contributes only 15.5% — a 2.5× seasonal imbalance.
- The South region is the weakest performer across all three product categories, indicating a structural distribution problem, not a product issue.
- 50.8% of all orders contain only a single line item — representing a large untapped cross-selling opportunity.
- Home Office customers have the highest average order value (\$475.37) but receive the least business development attention.
- 27 orders (0.5% of all orders) account for 10.5% of total revenue — these high-value "whale" accounts require dedicated relationship management.

2. Dataset & Methodology

2.1 Data Source

The analysis is based on the Sample Superstore dataset, a widely used retail analytics benchmark available on Kaggle. It simulates real-world sales data from a US office supply and technology retailer operating across four regions.

Attribute	Detail
Dataset name	Sample Superstore (Tableau / Kaggle)
Time period	1 January 2015 – 31 December 2018
Total records	9,800 transaction line items
Unique orders	4,922 orders across 4 years
Unique customers	793 individual customer accounts
Product SKUs	1,849 unique product names
Geographies	49 US states, 4 regions, 531 cities
Columns	18 fields including Sales, Category, Region, Segment, Ship Mode

2.2 Analytical Approach

The following analysis types were performed on the dataset:

- Descriptive statistics — total sales, order counts, average order values, and distributions across all dimensions.
- Time-series analysis — year-over-year growth, monthly seasonality patterns, and order volume trends.
- Segmentation analysis — performance breakdown by region, category, sub-category, customer segment, and shipping mode.
- Concentration analysis — Pareto (80/20) distribution of products, geographic concentration, and high-value order identification.
- Cross-dimensional analysis — category performance within each region, segment behaviour across shipping modes.
- Growth decomposition — sub-category year-over-year growth rates to identify rising and declining product lines.

2.3 Limitations

- The dataset contains only Sales revenue figures. Without Cost of Goods Sold (COGS), profit margin, or return data, profitability analysis is not possible. A high-revenue product may in fact be low-margin.

- 11 records have missing postal codes (0.1% of data) — excluded from geographic analyses without material impact.
- Customer demographic data is not available; segment analysis is limited to Consumer, Corporate, and Home Office categories.

3. Revenue & Growth Analysis

3.1 Year-over-Year Revenue Trend

Total revenue across the four-year period amounted to \$2,261,536.78. The trajectory reveals a growth story with an important early disruption.

Year	Revenue	Orders	YoY Growth	Assessment
2015	\$479,856	947	Baseline	Establishing
2016	\$459,436	1,019	-4.3%	Warning year
2017	\$600,193	1,295	+30.6%	Strong recovery
2018	\$722,052	1,661	+20.3%	Sustained growth

The 2016 revenue contraction of 4.3% is a critical data point. Notably, order volume actually increased in 2016 (947 to 1,019 orders — a +7.6% rise), meaning the dip was driven by a fall in average order value, not customer attrition. This suggests a pricing or product-mix shift in 2016 — possibly an increase in lower-value product sales or discount activity — rather than a loss of customers.

The strong recovery in 2017 (+30.6%) and continued growth in 2018 (+20.3%) confirm that the business corrected course effectively. Order volume grew 75% over the period (947 to 1,661), demonstrating healthy customer acquisition alongside sustained average spend.

Key Insight

2016 saw more orders but less revenue — a signal of margin erosion through lower-value sales or discounting. Identifying and avoiding repeat occurrences should be a management priority.

3.2 Seasonal Revenue Patterns

Monthly revenue analysis reveals dramatic seasonal variation with a clear Q4 concentration and a dangerous Q1 trough.

Period	Revenue	% of Annual	Implication
November (peak)	\$350,162	15.5%	Highest single month — holiday/year-end buying
December	\$321,480	14.2%	Second highest — Q4 sustained strength
September	\$300,103	13.3%	Back-to-office / Q3 procurement surge
October	\$199,496	8.8%	Q4 buildup month

Period	Revenue	% of Annual	Implication
February (low)	\$59,371	2.6%	Lowest month of the year — post-holiday freeze
January	\$94,292	4.2%	Second weakest — Q1 demand collapse
Q4 Total (Oct–Dec)	\$871,138	38.5%	Nearly 2 in 5 dollars earned in 3 months
Q1 Total (Jan–Mar)	\$351,236	15.5%	25% the rate of Q4 — critical gap

The Q4 concentration is both an asset and a risk. While strong Q4 performance inflates annual revenue, an over-reliance on year-end buying means that any disruption to Q4 (supply chain issues, economic downturn, competitor promotions) could be catastrophic. The February low of \$59,371 represents just 2.6% of annual sales — 5.9× less revenue than November in the same calendar cycle.

Recommendation

Introduce a "Q1 Reactivation Campaign" targeting corporate buyers for annual supply contracts, offering early Q1 pricing incentives. This is the single highest-leverage revenue smoothing opportunity available without acquiring new products or customers.

4. Geographic Performance Analysis

4.1 Regional Revenue Distribution

Revenue is distributed across four US regions with a meaningful performance gap between the best and worst performers.

Region	Revenue	Share	vs Best	Priority
West	\$710,220	31.4%	Benchmark	Protect
East	\$669,519	29.6%	−5.7%	Grow
Central	\$492,647	21.8%	−30.6%	Develop
South	\$389,151	17.2%	−45.2%	Urgent

The South region generates 45% less revenue than the West. Critically, this underperformance is consistent across all three product categories (Technology, Furniture, and Office Supplies), ruling out any product-specific explanation. The issue is geographic market penetration — the business does not have sufficient sales presence, brand awareness, or distribution infrastructure in the South.

4.2 Category Performance by Region

The following matrix reveals cross-dimensional revenue performance. Technology is the strongest category in every region, but regional gaps within categories are significant.

Category	Central	East	South	West
Technology	\$168,739	\$263,117	\$148,195	\$247,405
Furniture	\$160,317	\$206,461	\$116,531	\$245,348
Office Supplies	\$163,590	\$199,941	\$124,425	\$217,467

The South is the lowest performer in every single category row. This pattern strongly indicates that the South has a distribution, sales presence, or brand recognition problem that affects the entire product portfolio equally. No amount of product improvement will fix a geographic access problem.

4.3 State-Level Concentration Risk

Zooming into state-level data reveals a severe geographic concentration that poses a business continuity risk.

Rank	State	Revenue	% of Total	Risk Flag
1	California	\$446,306	19.7%	High concentration
2	New York	\$306,361	13.5%	High concentration
3	Texas	\$168,573	7.5%	Monitor
4	Washington	\$135,207	6.0%	Monitor
5	Pennsylvania	\$116,277	5.1%	Stable

California and New York alone account for 33.2% of total four-year revenue. The top three states (CA, NY, TX) account for 40.7%. At the other extreme, North Dakota generated just \$920 over four full years. This concentration means that any economic, competitive, or operational disruption in California would have an outsized negative impact on the entire business.

4.4 Top Cities

New York City (\$252,463) is the single highest-revenue city, generating more than twice the revenue of Seattle (\$116,106) — the third-ranked city. The top five cities (NYC, LA, Seattle, San Francisco, Philadelphia) collectively account for 33.6% of total revenue.

Recommendation

Develop a Southern States Growth Plan: hire regional sales representatives, establish local partnerships, and run targeted digital advertising campaigns in key Southern metros (Atlanta, Charlotte, Nashville, Dallas, Houston). The South represents the largest single growth opportunity in the existing geographic footprint.

5. Product & Category Analysis

5.1 Category Performance

Three product categories are tracked, with Technology generating the most revenue — though the gap between categories is narrower than often assumed.

Category	Revenue	Share	Observation
Technology	\$827,456	36.6%	Highest revenue; driven by high unit price items
Furniture	\$728,659	32.2%	Strong but likely low-margin (bulky, high return rate)
Office Supplies	\$705,422	31.2%	Consistent, high-frequency repeat purchases

The relative balance between categories (36.6% / 32.2% / 31.2%) is a sign of healthy diversification. Technology leads on revenue but may not lead on profit given the high cost of electronics inventory. Office Supplies, while third in revenue, likely generates more consistent cash flow due to smaller, more frequent transactions.

5.2 Sub-Category Rankings

Phones and Chairs are the top two sub-categories, collectively contributing \$650,605 (28.8% of total revenue). The gap between the top and bottom performers is extreme.

Rank	Sub-Category	Revenue	Category	Status
1	Phones	\$327,782	Technology	Star
2	Chairs	\$322,823	Furniture	Star
3	Storage	\$219,343	Office Supplies	Strong
4	Tables	\$202,811	Furniture	Strong
5	Binders	\$200,029	Office Supplies	Strong
15	Envelopes	\$16,128	Office Supplies	Low
16	Labels	\$12,348	Office Supplies	Low
17	Fasteners	\$3,002	Office Supplies	Review

Fasteners generate just \$3,002 over four years — a 109× difference compared to Phones. While low-value items like fasteners and labels may serve as convenience products that support bundle purchases, their individual contribution is negligible and likely not worth dedicated shelf space or marketing investment.

5.3 Sub-Category Growth Trends (2017 vs 2018)

Year-over-year growth analysis for 2017 to 2018 reveals which sub-categories are accelerating and which are declining — critical intelligence for 2019 planning.

Sub-Category	YoY Growth	Signal	Action
Appliances	+54.6%	Rising star	Increase inventory & promotion budget
Art	+49.8%	Rising star	Expand SKU range
Binders	+46.4%	Accelerating	Maintain momentum
Accessories	+39.5%	Accelerating	Cross-sell with Phones
Phones	+34.2%	Strong growth	Protect market position
Tables	+0.2%	Stagnating	Review product range
Fasteners	−9.6%	Declining	Consider SKU reduction
Machines	−22.1%	Sharp decline	Urgent category review required
Envelopes	−24.2%	Sharp decline	Assess whether to discontinue

Critical Finding — Machines Decline

Machines fell 22.1% in 2018 after performing strongly in 2017. This sub-category (\$189,239 total revenue) is significant, and a one-year double-digit decline may signal a product lifecycle issue, a competitor move, or a pricing problem. An immediate category review is recommended before the next planning cycle.

5.4 Pareto Analysis — SKU Concentration

The Pareto principle holds strongly in this dataset. A small number of products generate a disproportionate share of revenue.

SKU Cohort	Products	% of Catalogue	Revenue	% of Total
Top 1 product	1	0.05%	\$61,600	2.7%
Top 5 products	5	0.3%	\$153,385	6.8%
Top 20 products	20	1.1%	\$388,884	17.2%
Remaining SKUs	1,829	98.9%	\$1,872,653	82.8%

The Canon imageCLASS 2200 Advanced Copier is the single best-selling product at \$61,600 — accounting for 2.7% of all revenue from one SKU out of 1,849. The top 20 products (1.1% of the catalogue) generate 17.2% of revenue. This means 98.9% of SKUs must collectively cover the

remaining 82.8% — indicating a long tail of low-performing products that may not justify their inventory, listing, and logistics costs.

Recommendation

Conduct a formal SKU Rationalisation Review. Identify the bottom 200 SKUs by contribution margin (revenue minus estimated cost of carry). Discontinuing chronic low-performers frees warehouse space, reduces complexity, and allows reinvestment in the top 20 revenue-generating products.

6. Customer Segment Analysis

6.1 Segment Revenue Overview

Three customer segments are tracked: Consumer (individual buyers), Corporate (business accounts), and Home Office (small business/remote workers). Consumer dominates in total revenue but not in per-order efficiency.

Segment	Total Revenue	Share	Avg Order Value	Insight
Consumer	\$1,148,061	50.8%	\$452.53	Largest volume; mid AOV
Corporate	\$688,494	30.4%	\$461.77	Moderate volume; higher AOV
Home Office	\$424,982	18.8%	\$475.37	Smallest segment; HIGHEST AOV

The Home Office finding is one of the most strategically significant insights in this entire analysis. Home Office customers, despite generating the least total revenue (18.8% share), spend the most per transaction — \$475.37 on average, compared to \$452.53 for Consumer buyers. This means Home Office customers are the most valuable buyers per interaction, yet they receive the smallest share of sales and marketing resources.

Hidden Opportunity — Home Office Segment

If Home Office customers were acquired at the same volume as Consumer customers (while maintaining their superior average order value), the segment would generate approximately \$1,353,000 in revenue — an incremental \$928,000 on top of current Home Office performance. Even a 20% volume increase for Home Office would add approximately \$85,000 in annual revenue with no changes to product range.

6.2 High-Value Order Analysis (Whale Accounts)

Order value distribution analysis reveals a heavily right-skewed pattern — most orders are modest, but a small number of very large orders contribute disproportionately to revenue.

Metric	Value	Implication
Average order value	\$459.48	Inflated by outliers
Median order value	\$151.88	Typical order is much smaller than the mean
Largest single order	\$23,661	Corporate or institutional buyer
Orders exceeding \$5,000	27 orders	0.55% of all orders

Metric	Value	Implication
Revenue from \$5,000+ orders	\$238,220	10.5% of total revenue

The mean-to-median gap (\$459 vs \$152, a 3× difference) confirms a classic power-law revenue distribution. Just 27 orders — less than 0.6% of all transactions — account for 10.5% of four-year revenue. Losing even five of these accounts in a single year would represent a material revenue impact equivalent to losing hundreds of average customers.

Recommendation

Establish a Key Account Management (KAM) programme for orders exceeding \$3,000. Assign dedicated account managers to the top 50 customers by lifetime value. Offer these accounts priority fulfilment, extended payment terms, and exclusive pricing. The cost of one account manager is justified by retaining two or three whale accounts per year.

6.3 Cross-Selling Gap — Basket Size Analysis

Analysis of items per order reveals that the business has a significant opportunity to increase revenue per transaction without acquiring new customers.

Basket Size	Order Count	% of Orders	Opportunity
Single item (1 line)	2,499	50.8%	Highest priority for cross-sell intervention
Two items	1,210	24.6%	Bundle upgrade opportunity
Three items	612	12.4%	Moderate cross-sell potential
Four or more items	601	12.2%	These customers already cross-buy naturally

More than half of all orders (50.8%) contain only a single product line. If even 15% of these single-item orders could be converted to two-item orders through strategic product recommendations, this would generate approximately 375 additional revenue-generating line items — at an estimated average value of \$230 each, contributing approximately \$86,000 in incremental revenue per year.

7. Operational Analysis — Shipping & Fulfilment

7.1 Shipping Mode Performance

Four shipping modes are available. Standard Class dominates in volume but is the slowest option, raising customer satisfaction risk.

Ship Mode	Orders	Order %	Revenue	Avg Days	Avg Revenue/Order
Standard Class	2,945	59.8%	\$1,340,831	5.0 days	\$455
Second Class	944	19.2%	\$449,914	3.2 days	\$477
First Class	772	15.7%	\$345,572	2.2 days	\$448
Same Day	261	5.3%	\$125,219	0.04 days	\$480

Standard Class handles nearly 60% of all orders at an average delivery time of five full days. In the current e-commerce environment where 2-day delivery has become a consumer expectation, this represents a potential competitive disadvantage. Notably, Same Day delivery correlates with the highest average order value (\$480) — suggesting that customers who need fast fulfilment are often buying higher-value items.

7.2 Shipping Efficiency Observations

- Same Day shipping, despite being the fastest and highest AOV mode, is used for only 5.3% of orders — suggesting either limited availability or low customer awareness.
- Second Class (3.2 days average) generates a higher average order value (\$477) than Standard Class (\$455) despite slower speed — indicating that customers using Second Class may be making more considered, higher-value purchases.
- First Class (2.2 days average) is the third most used mode, suggesting a segment of customers who value speed but do not require same-day service.

Recommendation

Partner with carriers to reduce Standard Class average delivery to 3 days. Simultaneously, promote Same Day delivery to Home Office and Corporate segments through targeted email campaigns. Given that Same Day correlates with the highest AOV (\$480), increasing its adoption rate from 5.3% to 10% would increase weighted average order value across the business.

8. Strategic Recommendations

The following nine recommendations are derived directly from the data analysis in this report. They are ranked by estimated revenue impact and grouped into immediate actions (0–3 months) and medium-term initiatives (3–12 months).

8.1 Immediate Actions (0–3 Months)

R1: Launch a Q1 Revenue Recovery Campaign

Finding: Q1 revenue is \$351,236 — just 40% of Q4 revenue. February alone generates only 2.6% of annual sales.

Action: Design a January campaign targeting Corporate and Home Office segments. Offer "Annual Supply Contracts" with 5–8% early-commitment discounts for Q1 orders. Partner with procurement teams at existing Corporate accounts to lock in annual spend before competitors approach them.

Metric	Current	Target (Year 1)
February revenue	\$59,371	\$85,000 (+43%)
Q1 total revenue	\$351,236	\$440,000 (+25%)

R2: Establish a Key Account Management Programme

Finding: 27 orders over \$5,000 account for 10.5% of revenue. The median order (\$152) is 3× lower than the mean (\$459), indicating heavy concentration in a small number of high-value buyers.

Action: Identify the top 50 customers by four-year lifetime value. Assign dedicated account managers, offer priority fulfilment (guaranteed First Class or Same Day), provide quarterly business reviews, and create customised pricing tiers. Implement a formal contract renewal process to reduce churn risk.

R3: Investigate and Reverse the Machines Sub-Category Decline

Finding: Machines revenue fell 22.1% in 2018 after strong 2017 performance. This is the sharpest decline of any sub-category.

Action: Conduct an immediate product-by-product review within the Machines sub-category. Identify whether the decline is concentrated in specific SKUs (end-of-lifecycle products) or spread across the category (pricing or competitor issue). If pricing is the cause, consider a targeted discount or bundle offer with high-margin accessories. If products are end-of-lifecycle, plan for proactive range refresh before 2019 Q2.

8.2 Medium-Term Initiatives (3–12 Months)

R4: Southern Region Market Development

Finding: The South generates \$389,151 — 45.2% less than the West. This gap is consistent across all three product categories, confirming a distribution problem rather than a product issue.

Action: Develop a dedicated Southern Region Sales Strategy. Hire a regional sales lead for the Southeast (Atlanta hub) and Southwest (Dallas hub). Run geo-targeted digital advertising in Atlanta, Charlotte, Nashville, Houston, and Miami. Consider partnering with local resellers or distributors to access markets where direct sales are not yet established.

Investment	Estimated Cost	Revenue Target	Timeline
Regional sales lead (SE)	\$65,000/yr	Additional \$120K in year 1	3 months to hire
Digital advertising (Southern)	\$18,000/yr	Additional \$45K in year 1	Immediate
Local partner programme	\$10,000/yr	Additional \$60K in year 1	6 months setup

R5: Home Office Segment Targeted Growth

Finding: Home Office buyers have the highest average order value (\$475.37) but the smallest revenue share (18.8%). They are the most efficient buyers in the portfolio.

Action: Create a "Home Office Professional" programme — a dedicated landing page, curated product bundles for home office setup (Chair + Desk + Tech bundle), and an email nurture sequence for newly acquired Home Office customers. Offer a loyalty tier specifically for this segment with 3–5% rebates on annual spend above \$2,000. Target acquisition through LinkedIn and remote-work community channels.

R6: Implement a Cross-Selling Engine

Finding: 50.8% of orders contain only one line item. The business is missing revenue on every second transaction by not offering complementary products.

Action: Implement product recommendation logic at the order stage (whether online or via sales team). Specific bundles to create: Phones + Phone Accessories (Accessories grew 39.5% in 2018), Chairs + Furnishings, Copiers + Paper. Train the sales team to offer one complementary product suggestion on every order call. Even a 15% bundle conversion rate yields approximately \$86,000 in incremental annual revenue.

R7: Accelerate Investment in Appliances

Finding: Appliances grew 54.6% in 2018 — the fastest-growing sub-category. Current revenue is \$104,618.

Action: Expand the Appliances SKU range before competitors react to this trend. Increase marketing budget allocation for Appliances. Create "Office Appliance Upgrade" bundle packages combining top-selling appliances with adjacent Office Supplies products to lift basket size in this growing category.

R8: Reduce Geographic Concentration Risk

Finding: California and New York account for 33.2% of total revenue. A disruption in these two states could be catastrophic.

Action: Set a medium-term strategic target to reduce the combined CA + NY revenue share to below 25% by growing revenue in currently underpenetrated states. Focus growth efforts on: Florida (large population, currently underperforming), Illinois (major corporate hub), and Ohio (central US distribution advantage).

R9: SKU Rationalisation and Portfolio Optimisation

Finding: Top 20 products (1.1% of catalogue) = 17.2% of revenue. The bottom 200 products likely generate under 1% collectively.

Action: Conduct a quarterly SKU performance review. Establish a minimum revenue threshold (e.g., \$500 per year) below which products are placed on "watch list". After two consecutive quarters below threshold, initiate discontinuation process. Reallocate freed-up catalogue management, warehousing, and marketing resources toward expanding the top 20 SKU range (more variants, bundle packs, priority promotions).

9. Recommendations Summary Matrix

The following matrix provides a consolidated view of all nine recommendations, their evidence base, estimated impact, and implementation timeline.

#	Recommendation	Evidence	Impact	Timeline
R1	Q1 Revenue Campaign	Feb = 2.6% of sales; Q1 = 15.5%	High	0–1 month
R2	Key Account Management	27 orders = 10.5% revenue	High	1–3 months
R3	Machines Decline Review	Machines –22% in 2018	High	Immediate
R4	South Region Development	South –45% vs West	High	3–6 months
R5	Home Office Growth Programme	HO has highest AOV (\$475)	High	2–4 months
R6	Cross-Sell Engine	50.8% single-item orders	Medium	3–6 months
R7	Appliances Investment	Appliances +54.6% YoY	Medium	3–6 months
R8	Geographic Diversification	CA+NY = 33.2% of revenue	Medium	6–12 months
R9	SKU Rationalisation	Top 1.1% SKUs = 17.2% revenue	Medium	3–6 months

10. Conclusion

This analysis of four years of Superstore sales data reveals a business with genuine strengths and significant untapped potential. The 50.5% cumulative revenue growth from 2015 to 2018, combined with a 75% increase in order volume, demonstrates that the business has strong demand drivers and a loyal customer base. Technology products, West and East regional operations, and the Canon imageCLASS copier range are clear assets.

However, the analysis exposes several structural vulnerabilities that, if left unaddressed, will limit future growth and create concentration risk. The South region's consistent underperformance, the Q1 revenue drought, the 50.8% single-item order rate, and the geographic concentration in California and New York are all solvable problems — but they require deliberate strategic investment.

The most actionable insights from this report are:

- The Home Office segment is the most efficient buyer in the portfolio by average order value, yet the smallest by total revenue — a clear signal to invest in this segment's growth.
- Over half of all orders are single-item transactions, meaning the business is systematically leaving money on the table on more than 2,499 occasions per year.
- 27 "whale" orders account for 10.5% of revenue — protecting these accounts through formal key account management is the highest-return, lowest-cost action available.
- The South is not a product problem — it is a geographic presence problem that requires direct sales investment, not a product refresh.

Implementing even four of the nine recommendations above — specifically R1 (Q1 Campaign), R2 (Key Account Management), R4 (South Region), and R5 (Home Office) — could realistically increase annual revenue by \$250,000–\$350,000 within 18 months, representing a 35–48% improvement on the 2018 baseline of \$722,052.

Data-driven decisions of this nature do not require large capital investment. They require leadership commitment to act on what the data clearly shows.
